# CaptureFlow

Sinar Software

Ihr Solution Provider  
Workflow-Software with Color-management

# The Sinar Capture Software “CaptureFlow” with a constant color-management in cooperation with basIC Color GmbH

## Integrated Color-management

Thanks to CaptureFlow’s integrated color-management solution, the highest professional color accuracy and image quality results.

## True color Live Image

The legendary Sinar live image, using CaptureFlow color-management, displays high quality accurate color. Gridlines as well as tilt-swing-axis can be adjusted to flexible sizing.

## Overlay Function

Precise positioning of the subject according to a design layout is supported with the overlay function. JPEG files can be projected offering useful camera set-up functionalities.

## 3 Focus Points

For quality focus set-up, three active focus points are possible, a single focus point, or in combination displaying three live focus areas.

## Comparative View

In the comparative view four images can be displayed at once - side by side or one above the other. The loupe function can be activated on one or on all the images.

## Image Export

Sinar CaptureFlow can export images in RGB or ready to print CMYK-encoding. Rendering intent, file format, sharpening filters, data names and color depth can be applied as a specific export process.

## User Interface

Software tools can be positioned according to individual preferences. CaptureFlow offers the possibility to operate from two displays.

## Camera Calibration

Best image results are achieved by color calibration of the digitalback – new calibrations are necessary when lighting conditions are changed. CaptureFlow offers color calibration in a four step process.

## Flexibility and Innovation

CaptureFlow combines many years of experience and know-how of two professional photo enterprises to an innovative product. The technically sophisticated software is geared to the high demands of professional photographers. The partnership between Sinar – the solution provider for high-end cameras – and the color management specialist basICColor leads to the creative and workflow-oriented image processing software CaptureFlow. Thanks to the sophisticated color profiling solutions the photographer gains high quality images and an optimized workflow.

## Shading

CaptureFlow allows for a shading potential during capture and or processed later if required to correct color or unbalanced lighting fall-off. The shading correction can be selected from four different strengths.
